

CARE TIPS FOR YOUR OFFICE CHAIR

To keep your new office chair beautiful for a long time, it should be cleaned regularly. Here are a few practical tips on how to care for your office chair and how to properly treat and clean leather, synthetic / faux leather and fabric.

BASIC CLEANING

Over time, crumbs, hair, dust and lint can accumulate on the surface and cracks of your office chair. Therefore, from time to time (depending on the amount of soiling approx. every 3 months) you should vacuum the surfaces and cracks of the office chair.

Use a suitable vacuum cleaner attachment.

FOR THE CARE AND CLEANING OF THE VARIOUS SEAT COVERS, PLEASE NOTE THE FOLLOWING INFORMATION:

LEATHER: CARE AND CLEANING

Leather is very durable. Therefore, leather covers need special care and cleaning. Leather may only be cleaned with appropriate care products from the furniture trade. In general, leather furniture should be treated twice a year with the appropriate care product to maintain its suppleness. Avoid sun exposure and heat (for example, do not place directly in front of the heater) to prevent the leather from fading and becoming brittle.

First, thoroughly vacuum the cover with a vacuum cleaner and then wipe off all surfaces with a hand warm, damp cloth. For heavier soiling, please use a special stain remover for leather. To keep the leather supple, we recommend treatment of the surfaces with a leather care milk, which you apply with a cloth evenly on the leather. The color of the leather chair will then shine again more intensely.

Afterwards, the leather can also be impregnated with a special leather cream.

SYNTHETIC LEATHER: CARE AND CLEANING

In general, synthetic leather is very easy to care for. However, it wears faster than genuine leather and can dry out and crack over time. Please do not clean artificial leather with aggressive cleaning, solvents or abrasives.

Lighter stains can usually be removed when wiping in circular motions with a damp cloth. For more pronounced or dried stains, add some detergent to the water, treating the stain with a soft brush and very little pressure. Then dab the moist areas dry with a clean cloth.

To prevent your synthetic leather cover from drying out, you can spray it with a waterproof spray and thus protecting the surface against dirt. However, if a few cracks in the synthetic leather are already visible, you can treat them with a special synthetic leather care product.

Note: Never use oily lotions with artificial leather. It would only form an oily film on the surface and at worst affect the synthetic leather.

FABRIC: CARE AND CLEANING

Fabric covered office chairs should be carefully cleaned 2-3 times a year. Often dirt, dust and perspiration penetrate into the fabric cover. Most soils are easy to remove, with a vacuum cleaner. You can also clean removable fabric covers in the washing machine. You can remove strongly soiled areas and stains with a suitable cleaning agent e.g. baking soda.

Baking soda removes bad odors, is odorless and inexpensive. Use a sponge to rub the baking soda evenly on the fabric surface and allow it to work for several hours. Then remove the baking soda with a clean cloth and vacuum the residue. In case of stronger soiling, mix the baking soda with a little water, creating a paste and allow this mixture to work for a while. Then remove the paste and the stain should be removed.
